Activity 4: Resilience Ecosystem After a Service Surge

Course C1158 · LO2

Objective

Redesign job demands and resources while adding proportionate resilience support

Documented real-event basis

CIPD's evidence review treats resilience as influenced by individual and contextual factors and cautions against placing the onus on employees to withstand harmful conditions. Protective factors include self-efficacy, positive affect, social support and leader relationships; effective development tends to be structured and experiential rather than a one-off lecture.

Scenario

CivicConnect, a fictional public-facing service centre, experienced a four-month demand surge. Employees report unpredictable overtime, abusive callers, low control and slow escalation. Management initially proposes a one-hour resilience webinar.

Primary source

https://www.cipd.org/globalassets/media/knowledge/knowledge-hub/evidence-reviews/employee-resilience-discussion-report_tcm18-91717.pdf

Training assumptions

• CivicConnect and all employee evidence are fictional training inputs.

• There is no evidence that a one-hour webinar alone will address the primary work demands.

• The operating budget allows changes to rosters, escalation, peer support and a targeted development programme.

• Any clinical support must be delivered by appropriately qualified providers.

Questions

1. Which demands are preventable, reducible or unavoidable?

2. Which resources are missing at individual, team and organisational levels?

3. What sequence balances immediate relief with sustainable redesign?

4. How will leaders know whether the change improves recovery and service?

Expected output

Resilience ecosystem map and a 90-day multi-level implementation plan

Acceptance test

The plan removes or reduces at least two preventable demands, adds team and organisational resources, treats individual training as complementary, includes safe escalation and has balanced employee/service measures.
