Activity 10: Wellbeing Programme Management Review

Course C1158 · LO3

Objective

Assess programme effectiveness and recommend scale, adaptation or stop

Documented real-event basis

McKinsey's workplace research presents wellbeing as a leadership priority and highlights organisational enablers such as psychological safety, purpose and adaptable support. The source supports a systems perspective; the fictional programme dataset must be evaluated on its own quality and cannot inherit causal conclusions.

Scenario

ApexFin Services, a fictional 760-person employer, piloted manager training, protected focus time, EAP navigation and peer mentoring for 12 months. Participation rose, but absence and turnover moved differently across units. Leaders ask whether to scale nationally.

Primary source

https://www.mckinsey.com/featured-insights/mckinsey-guide-to-navigating-the-new-world-of-work/thriving-at-work-building-resilience-wellness-and-motivation

Training assumptions

• All programme, outcome, cost, baseline and comparison data are fictional.

• Business units were not randomly assigned; workload and leadership changes occurred during the pilot.

• Small groups and sensitive service data must be aggregated before management reporting.

• The decision options are scale, adapt and extend pilot, pause, or stop—not simply pass/fail.

Questions

1. Did delivery reach the intended groups safely and equitably?

2. What evidence supports changes in experience, work conditions and outcomes?

3. Which alternative explanations and data-quality weaknesses limit confidence?

4. What should management scale, adapt, pause or stop, and what is the next review trigger?

Expected output

Balanced programme dashboard and management decision paper

Acceptance test

The review validates data, follows the logic model, separates implementation from outcome, analyses equity, names confounders, avoids causal overclaiming and gives component-level decisions with owners and review triggers.
